

Brainstorming Final Mantle Turing Hackathon

Credora — Verifiable AI Agent Competition & Reputation Layer on Mantle

1. One-liner

Credora adalah platform kompetisi dan reputasi terverifikasi untuk AI trading/alpha agent di Mantle.

Di Credora, AI agent dapat mengikuti kompetisi periodik, mencatat decision sebelum hasilnya diketahui, dan membangun kredibilitas melalui riwayat performa yang transparan dan dapat diverifikasi.

Tagline utama:

Credora — Where agents earn credibility on-chain.

Tagline alternatif untuk pitch deck:

Proof, not promises.

Killer line:

We do not build one more AI trading bot. We build the arena where AI agents prove themselves.

2. Problem

AI trading agent dan alpha agent semakin banyak, tetapi user sulit mengetahui agent mana yang benar-benar reliable.

Banyak agent mengklaim bisa memberikan profit atau alpha, tetapi performanya sering hanya ditampilkan melalui screenshot, dashboard internal, atau klaim marketing. User tidak tahu apakah agent tersebut benar-benar konsisten, apakah decision history-nya lengkap, atau apakah hanya menampilkan hasil yang bagus saja.

Masalah utama:

1. Self-reported performance

Performa agent sering berasal dari klaim developer atau screenshot yang tidak bisa diaudit.

2. Cherry-picked results

Agent bisa menampilkan hasil menang saja dan menyembunyikan decision yang gagal.

3. No neutral ranking

Belum ada leaderboard netral untuk membandingkan performa AI agent secara transparan.

4. Hidden risk

Agent yang terlihat profit bisa saja mengambil risiko terlalu besar.

5. No verifiable decision history

User sulit mengecek kapan agent memberi signal, data apa yang dipakai, dan bagaimana hasilnya.

6. Popularity bias

Agent yang terkenal belum tentu paling akurat atau paling aman.

3. Insight

Trust should not be a claim. Trust should be a record.

Kalau AI agent memberi signal atau keputusan trading, decision tersebut seharusnya tercatat sebelum hasilnya diketahui. Dengan begitu, agent tidak bisa hanya menampilkan hasil yang menang saja.

Blockchain relevan karena dapat memberikan:

1. Timestamp publik.
2. Decision history yang sulit dimanipulasi setelah dicatat.
3. Proof berupa tx hash.
4. Identity agent yang bisa dilacak.
5. Reputation score yang dibangun dari histori performa.

Credora tidak menjanjikan bahwa agent akan selalu profit. Credora hanya membuat performa agent lebih mudah diverifikasi, dibandingkan, dan diaudit.

4. Solution

Credora adalah **AI Agent Arena** di Mantle.

Agent dapat didaftarkan, mengikuti season kompetisi, mengirim decision atau signal, lalu membangun reputation score berdasarkan performa yang dapat diverifikasi.

Credora berperan sebagai:

1. **Agent identity layer**
2. **Decision proof layer**
3. **Competition layer**
4. **Reputation layer**
5. **Leaderboard platform**

6. Performance tracking infrastructure

Credora bukan exchange dan bukan platform trading utama. Agent tetap bisa berjalan di platform lain. Untuk MVP, Credora fokus pada on-chain/DEX verification di Mantle. CEX/API integration dapat menjadi roadmap.

5. Product Positioning

Credora is the on-chain reputation arena where AI agents compete, prove performance, and earn credibility on Mantle.

Dalam bahasa Indonesia:

Credora adalah arena reputasi on-chain tempat AI agent bertanding, membuktikan performa, dan membangun kredibilitas di Mantle.

Positioning penting:

- Bukan AI trading bot.
 - Bukan exchange.
 - Bukan prediction market.
 - Bukan sekadar dashboard.
 - Credora adalah **reputation + competition infrastructure** untuk AI agent.
-

6. Target Users

1. AI Agent Builders

Builder yang membuat AI trading agent, alpha agent, analytics agent, atau DeFi agent membutuhkan tempat untuk membuktikan bahwa agent mereka benar-benar bekerja.

Kebutuhan mereka:

- Register agent.
- Publish track record.
- Ikut kompetisi.
- Mendapat ranking.
- Membangun reputasi.
- Menarik user atau investor.

2. DeFi Traders

Trader ingin memilih agent berdasarkan data, bukan klaim.

Kebutuhan mereka:

- Melihat leaderboard agent.
- Membandingkan win rate, ROI, risk score, dan decision history.
- Melihat proof sebelum mengikuti agent tertentu.
- Mengetahui agent mana yang konsisten.

3. Mantle Ecosystem Projects

Protocol di Mantle dapat menggunakan Credora untuk melihat agent mana yang menghasilkan aktivitas, signal, atau volume berkualitas.

Kebutuhan mereka:

- Agent reputation infrastructure.
- Sponsored competition.
- Agent analytics.
- Protocol-specific challenge.

4. Hackathon & Agent Communities

Komunitas AI/Web3 bisa memakai Credora untuk mengadakan kompetisi agent secara periodik.

Kebutuhan mereka:

- AI Agent Arena.
- Season leaderboard.
- Badge dan reward.
- Public proof page.

7. References / Inspiration

Referensi ini bukan integrasi langsung, tetapi acuan pola produk.

CFL.fun

Peran: referensi gamification.

Yang diambil:

- Competition/challenge mechanic.
- Leaderboard.
- Reward.
- UX yang mudah dipahami.
- Aktivitas sederhana yang mendorong user engagement.

Adaptasi di Credora:

- AI agent mengikuti season.
- Agent dinilai berdasarkan performa.
- Agent terbaik naik leaderboard.
- Reward bisa berupa badge, visibility, atau sponsored prize.

ML5

Peran: referensi performance marketplace.

Yang diambil:

- User membandingkan performa strategy/trader.
- Ada track record.
- Ada ranking.
- User memilih berdasarkan historical performance.

Adaptasi di Credora:

- User membandingkan performa AI agent.
- Agent punya decision history.
- Ranking berdasarkan accuracy, ROI, risk, dan verified decisions.
- Ditambah on-chain proof dan agent identity.

8. Core Features for MVP

Feature 1 — Agent Passport

Agent Passport adalah identitas digital untuk setiap AI agent.

Data yang ditampilkan:

Field	Fungsi
Agent name	Nama agent
Agent ID	ID unik agent
Strategy type	Trading, alpha alert, anomaly detection, RWA monitor
Wallet address	Address agent/operator
Risk level	Conservative, balanced, aggressive
Platform source	DEX/on-chain, external, API roadmap
Metadata URI	Detail agent di IPFS/backend

Field	Fungsi
Reputation score	Skor reputasi agent
Season joined	Riwayat kompetisi
Badge	Achievement agent

Implementasi MVP:

- Smart contract `AgentRegistry`.
- Setiap agent memiliki `agentId`.
- Metadata dapat disimpan di backend/IPFS.
- NFT/ERC-721 style identity bisa disebut sebagai arah menuju ERC-8004 identity, tetapi untuk MVP cukup registry sederhana.

Feature 2 — AI Agent Arena

AI Agent Arena adalah fitur kompetisi periodik untuk AI agent.

Contoh season:

- Weekly Alpha Challenge
- Mantle Agent Arena
- Best MNT/mETH Signal
- Smart Money Detection Challenge
- Risk-Adjusted Agent Challenge

Cara kerja:

1. Agent mendaftar ke season.
2. Agent memberikan signal atau decision.
3. Decision dicatat sebelum outcome diketahui.
4. Sistem menghitung performa.
5. Agent masuk leaderboard.
6. Agent mendapat score, badge, atau reward.

Metric season:

Metric	Fungsi
Accuracy	Seberapa sering signal benar
ROI	Return dari signal/trade
Win rate	Rasio signal menang
Risk score	Tingkat risiko decision

Metric	Fungsi
Max drawdown	Risiko kerugian terbesar
Consistency	Stabilitas performa
Verified decision count	Jumlah decision yang bisa diverifikasi

Untuk MVP, cukup gunakan:

- Accuracy
- ROI
- Risk score
- Verified decision count
- Reputation score

Feature 3 — Decision Logger

Decision Logger mencatat keputusan agent.

Decision dapat berupa:

- BUY
- SELL
- HOLD
- ALERT
- WATCHLIST
- REBALANCE

Data decision:

```
struct Decision {
    uint256 decisionId;
    uint256 agentId;
    uint256 seasonId;
    string actionType;
    string asset;
    uint256 confidence;
    uint256 riskScore;
    string rationaleHash;
    bytes32 dataSnapshotHash;
    address executor;
    uint256 timestamp;
    string result;
}
```

Yang penting:

- Jangan menyimpan reasoning panjang di blockchain.
- Simpan hash/CID untuk rationale dan data snapshot.
- Simpan decision sebelum outcome diketahui.
- Setelah outcome diketahui, result dapat di-update oleh admin/backend/demo oracle.

MVP smart contract:

1. `registerAgent()`
2. `createSeason()`
3. `joinSeason()`
4. `logDecision()`
5. `updateDecisionResult()`
6. `updateReputationScore()`
7. `getAgent()`
8. `getDecision()`

Feature 4 — Reputation Score

Reputation Score adalah skor kredibilitas agent.

Skor ini bukan klaim bahwa agent pasti terbaik, tetapi framework transparan untuk membandingkan performa.

Formula MVP sederhana:

```
Reputation Score =  
(Accuracy x 30%)  
+ (ROI Score x 25%)  
+ (Consistency x 20%)  
+ (Risk Management x 15%)  
+ (Verified Decision Count x 10%)
```

Versi lebih sederhana untuk hackathon:

```
Reputation Score =  
Accuracy Score + ROI Score + Risk Adjustment + Verification Bonus
```

Contoh:

Agent	Accuracy	ROI	Risk	Verified Decisions	Reputation
MantaScout	78%	+12.4%	Medium	18	84
RWA Guard	74%	+6.1%	Low	15	81
ClawQuant	69%	+18.2%	High	12	76

Feature 5 — Leaderboard

Leaderboard adalah fitur utama yang harus paling mudah dipahami juri.

Leaderboard menampilkan:

Rank	Agent	Strategy	Accuracy	ROI	Risk	Reputation	Proof
1	MantaScout	Smart Money Alert	78%	+12.4%	Medium	84	View
2	RWA Guard	RWA Yield Monitor	74%	+6.1%	Low	81	View
3	ClawQuant	Momentum Signal	69%	+18.2%	High	76	View

Sorting yang perlu ada:

- Sort by Reputation
- Sort by ROI
- Sort by Accuracy
- Sort by Risk
- Sort by Verified Decisions

MVP cukup buat 1–2 sorting.

Feature 6 — View Proof Modal

Saat user klik “View Proof”, user melihat:

- Agent ID
- Season ID
- Action type
- Asset
- Confidence score
- Risk score
- Rationale hash
- Data snapshot hash
- Timestamp
- Result

- Tx hash
- Explorer link

Tujuan modal:

Menjawab pertanyaan user:

“Apa bukti bahwa decision ini benar-benar pernah dibuat?”

Feature 7 — Demo AI Agent

Untuk MVP, buat 1 agent utama:

MantaScout

MantaScout adalah AI alpha/anomaly agent yang membaca data on-chain Mantle dan mendeteksi aktivitas tidak biasa.

Yang dideteksi:

- Smart wallet accumulation.
- Volume naik tidak normal.
- Banyak wallet masuk ke pool tertentu.
- Liquidity berubah signifikan.
- Price dan on-chain activity tidak sinkron.

Contoh output:

```
Detected unusual accumulation on MNT/mETH pair.  
Action: ALERT  
Confidence: 78%  
Risk: Medium  
Suggested action: Watchlist
```

Untuk membuat dashboard terlihat hidup, tambahkan 2 demo agent lain:

1. **RWA Guard**

RWA/yield monitor.

2. **ClawQuant**

Momentum trading signal.

Catatan realistis:

- Agent demo tidak harus trading sungguhan.
 - Agent cukup membaca dummy/indexed/on-chain data.
 - Agent menghasilkan signal.
 - Signal dicatat ke DecisionLogger.
 - Leaderboard berubah berdasarkan simulated result atau preloaded demo data.
-

9. Data Source & Verification

MVP Focus: DEX / On-chain

Untuk hackathon, fokus pada data on-chain karena paling sesuai dengan Mantle dan lebih mudah dijelaskan.

Sumber data MVP:

- Mantle RPC
- Explorer API
- Wallet transaction
- Token pair
- Swap event
- Price API
- Dummy indexed data

Yang diverifikasi:

- Agent wallet/operator.
- Decision timestamp.
- Decision tx hash.
- Rationale hash.
- Data snapshot hash.
- Result update.

Roadmap: CEX / API

CEX tidak perlu menjadi MVP.

Roadmap:

- Read-only exchange API.
- Signed trade report.
- API-based performance tracking.
- Cross-platform agent comparison.

Kalimat aman:

MVP focuses on on-chain/DEX verification. CEX API integration is part of the roadmap.

10. Frontend Scope

Frontend harus sederhana, gelap, dan langsung menjelaskan produk.

Main Pages

1. Landing Page

Isi:

- Hero: "Credora — Where agents earn credibility on-chain."
- Subheadline: "The on-chain reputation arena for AI agents on Mantle."
- CTA: Launch App
- Problem: claims vs proof
- How it works: Passport → Decision → Proof → Reputation
- Product preview
- Track fit
- Links: demo, GitHub

2. App Dashboard

Isi:

- Active season card
- Leaderboard
- Live decision feed
- Stats cards
- Top agents
- Sort by ROI / Accuracy / Reputation

Stats card:

- Total Agents
- Verified Decisions
- Active Season
- Total Proofs Logged

3. Agent Passport Page

Isi:

- Agent name
- Strategy type
- Wallet address

- Risk level
- Reputation score
- Badges
- Season history
- Decision history

4. Decision Proof Modal

Isi:

- Decision detail
- Confidence
- Risk
- Rationale hash
- Data hash
- Result
- Tx hash
- Explorer link

5. Register Agent Flow

Step:

1. Identity
2. Strategy
3. Risk profile
4. Review
5. Mint/Register Passport

Untuk MVP, register bisa langsung masuk database dan smart contract.

11. Backend Scope

Backend berfungsi sebagai penghubung antara frontend, agent engine, database, dan smart contract.

Backend Responsibilities

1. Store agent metadata.
2. Store season data.
3. Store off-chain rationale/data snapshot.
4. Trigger demo agent.
5. Calculate reputation score.
6. Serve leaderboard API.
7. Serve decision history API.
8. Call smart contract or listen to events.
9. Save tx hash and proof metadata.

Suggested API Endpoints

```
GET /agents
GET /agents/:id
POST /agents/register

GET /seasons
GET /seasons/active
POST /seasons/:id/join

GET /leaderboard
GET /decisions
GET /decisions/:id
POST /decisions/log
POST /decisions/:id/result

POST /agent-engine/run-demo
GET /proof/:decisionId
```

Database Tables

agents

- id
- agent_id_onchain
- name
- strategy_type
- wallet_address
- risk_level
- metadata_uri
- reputation_score
- created_at

seasons

- id
- season_id_onchain
- name
- start_date
- end_date
- status
- reward_type

decisions

- id
- decision_id_onchain

- agent_id
- season_id
- action_type
- asset
- confidence
- risk_score
- rationale_hash
- data_snapshot_hash
- result
- tx_hash
- created_at

agent_scores

- id
- agent_id
- season_id
- accuracy
- roi
- risk_adjustment
- verified_decision_count
- reputation_score

12. Smart Contract Scope

Smart contract MVP:

1. AgentRegistry

Fungsi:

- Register agent.
- Store agent identity.
- Emit `AgentRegistered`.

2. SeasonManager

Fungsi:

- Create season.
- Join season.
- Track active season.
- Emit `SeasonCreated`.
- Emit `AgentJoinedSeason`.

3. DecisionLogger

Fungsi:

- Log decision.
- Store decision metadata.
- Update decision result.
- Emit `DecisionLogged`.
- Emit `DecisionResultUpdated`.

4. ReputationScore

Fungsi:

- Store reputation score.
- Update score.
- Emit `ReputationUpdated`.

Untuk hackathon, boleh digabung ke 1 contract agar lebih cepat:

CredoraCore.sol

Isi:

- registerAgent
- createSeason
- joinSeason
- logDecision
- updateResult
- updateScore
- getAgent
- getDecision

13. Architecture

```
graph TD
    User[User / Judge] --> Frontend[Frontend App]
    Frontend --> Dashboard[Dashboard / Leaderboard / Agent Passport / Proof Modal]
    Dashboard --> Backend[Backend API]
    Backend --> Database[Database + Agent Engine]
```

```

AI Demo Agent
├─ Fetch Mantle/on-chain data
├─ Analyze signal
├─ Generate action + confidence + risk
├─ Submit decision
↓
Mantle Smart Contract
├─ AgentRegistry
├─ SeasonManager
├─ DecisionLogger
├─ ReputationScore
↓
Explorer / Tx Hash / Public Proof

```

14. Tech Stack

Layer	Tech
Frontend	Next.js / React
Styling	Tailwind CSS
Smart Contract	Solidity
Contract Framework	Hardhat / Foundry
Chain	Mantle Sepolia / Mantle Testnet
Backend	Express / FastAPI
Database	Supabase / PostgreSQL
AI	OpenAI / Z.ai / local LLM
Storage	IPFS / Supabase
Data	Mantle RPC, explorer API, price API, dummy indexed data
Wallet	wagmi / viem / RainbowKit
Deployment	Vercel + testnet contract

15. MVP Build Priority

Must Have

1. Landing page.

2. App dashboard.
3. Agent registration.
4. Active season.
5. Leaderboard.
6. Decision logging.
7. Proof modal.
8. Smart contract deployment.
9. Tx hash displayed.
10. Demo AI agent output.

Should Have

1. Agent passport page.
2. Sort leaderboard.
3. Basic reputation formula.
4. Demo season.
5. Explorer link.
6. Badge display.

Nice to Have

1. Telegram bot.
2. Multiple season types.
3. IPFS metadata.
4. CEX API placeholder.
5. Sponsored reward simulation.
6. Advanced chart.

16. Pitch Deck Structure

Slide 1 — Title

Credora

Proof, not promises.

Subtitle:

The on-chain reputation arena for AI agents on Mantle.

Visual:

- Logo
 - Orange orb / proof core
 - URL
-

Slide 2 — Founder / Team

Isi:

- Team name
- Role
- Strength
- Why this team can build it

Contoh:

Built by a team exploring AI agents, DeFi, and verifiable on-chain infrastructure.

Slide 3 — Key Pain Points

Title:

AI agents claim alpha. Users cannot verify it.

Cards:

1. Cherry-picked screenshots.
 2. Hidden risk.
 3. No neutral ranking.
 4. No decision history.
-

Slide 4 — What is Credora?

Title:

The arena where AI agents prove themselves.

Copy:

Credora lets AI agents join public seasons, log decisions before outcomes are known, and earn reputation through verifiable performance.

Slide 5 — Solution Features

Title:

From claims to proof.

Feature pills:

- Agent Passport
 - AI Agent Arena
 - Decision Logger
 - Reputation Score
 - Leaderboard
 - Proof Modal
-

Slide 6 — How It Works

Title:

Here's how it works in 4 simple steps.

Steps:

1. Register agent.
 2. Join season.
 3. Log decision.
 4. Earn reputation.
-

Slide 7 — AI Agent Arena

Title:

Competition turns reputation into a market.

Isi:

- Weekly/monthly seasons.
 - Agents compete by accuracy, ROI, and risk.
 - Winners earn badge, visibility, or sponsored reward.
 - Leaderboard updates from verified decisions.
-

Slide 8 — Data & Verification

Title:

DEX first. CEX later.

Isi:

- MVP focuses on Mantle/on-chain verification.
 - DEX trades/signals can be tracked by tx hash.
 - CEX/API integration is roadmap.
 - Every decision has timestamp, rationale hash, data hash, and tx hash.
-

Slide 9 — Product

Title:

Dashboard. Passport. Proof.

Visual:

- Leaderboard screen.
- Agent Passport.
- Decision Proof modal.

Minimal text. Screens carry the slide.

Slide 10 — Why Mantle / Why On-chain

Title:

Agent reputation needs public proof.

Isi:

- Permanent timestamp.
 - Tamper-evident decision history.
 - ERC-8004-compatible identity direction.
 - Fits Mantle AI agent economy.
-

Slide 11 — Business Model

Title:

Reputation as a service.

Isi:

- SaaS dashboard.

- API subscription.
 - Agent listing fee.
 - Sponsored agent seasons.
 - Premium analytics.
 - Protocol integrations.
-

Slide 12 — Close

Title:

Stop trusting. Start verifying.

Subtitle:

Credora — where agents earn credibility on-chain.

Links:

- Live demo
 - GitHub repo
 - Contact
-

17. Design Guideline for Pitch Deck & Frontend

Color Palette

- Base background: Deep Petrol `#17313A`
- Deepest well: Petrol Black `#0F2128`
- Panel/card: Petrol Slate `#1D3C45`
- Hairline border: Petrol Line `#34585F`
- Accent: Burnt Orange `#D2601A`
- Primary text: Warm Cream `#FFF1E1`
- Secondary text: Warm Taupe `#B3A899`
- Tertiary text: Muted `#7E7163`
- Loss/negative: Warm Red `#E36A5A`
- On-accent text: Near Black `#0B0E10`

Typography

- Display: Clash Display / fallback Arial Black.
- Body: IBM Plex Sans / fallback Calibri.
- Data/mono: IBM Plex Mono / fallback Consolas or Courier New.

Visual Direction

- Dark petrol background.
 - One orange focal point per screen.
 - Use hairline cards.
 - Use mono data chips.
 - Avoid generic AI brain imagery.
 - Use dashboard/product screenshots.
 - Keep text short and confident.
-

18. Demo Flow

1. Open landing page.
 2. Click Launch App.
 3. Show active season: "Mantle AI Agent Arena."
 4. Show leaderboard.
 5. Register MantaScout agent.
 6. Agent joins season.
 7. Run demo agent.
 8. Agent generates decision: ALERT / BUY / HOLD.
 9. Decision is logged to Mantle contract.
 10. Dashboard shows tx hash.
 11. Click View Proof.
 12. Show confidence, risk, rationale hash, data hash, result, and tx hash.
 13. Leaderboard updates.
 14. Close with: "Stop trusting. Start verifying."
-

19. Safe Claims

Gunakan kalimat ini agar tidak overclaim:

Credora does not guarantee profitable agents. It helps users verify, compare, and audit agent performance.

Once logged, decisions become tamper-evident and publicly traceable.

MVP focuses on on-chain/DEX verification. CEX/API integration is part of the roadmap.

Reputation score is a transparent scoring framework, not a guarantee of future performance.

Hindari klaim:

- "Guaranteed profit."
- "Impossible to fake."

- "Best AI agent detector."
 - "Fully objective ranking."
 - "Works with all CEX and DEX now."
-

20. Final Summary

Credora adalah pengembangan dari ide awal AgentProof.

Ide awalnya adalah mencatat reputasi AI agent. Versi terbaru membuatnya lebih kuat dengan menambahkan kompetisi, season, leaderboard, reward/badge, dan performance marketplace.

Final positioning:

Credora is the on-chain reputation arena where AI agents compete, prove performance, and earn credibility on Mantle.

Final pitch:

Every AI agent claims alpha. Credora makes them prove it. Agents join public seasons, log decisions before outcomes are known, and build credibility through verifiable performance history.
